

Concurrency budget: where a 70B host's 640 GB pool goes

8 x 80 GB ranks — the aggregate screen ≠ a per-rank fit guarantee

derived concurrency

$$C = \text{KV budget} \div \text{KV/request}$$

FP16 / 8-bit KV

$$C \approx 17.5 \quad (\div 24.904 \text{ GB/request})$$

→ integer floor 17 requests

FP8 KV

$$C \approx 32.4 \quad (\div 13.448 \text{ GB/request})$$

→ integer floor 32 requests

KV slot ticks on the FP16 bar mark the per-request boundaries.
