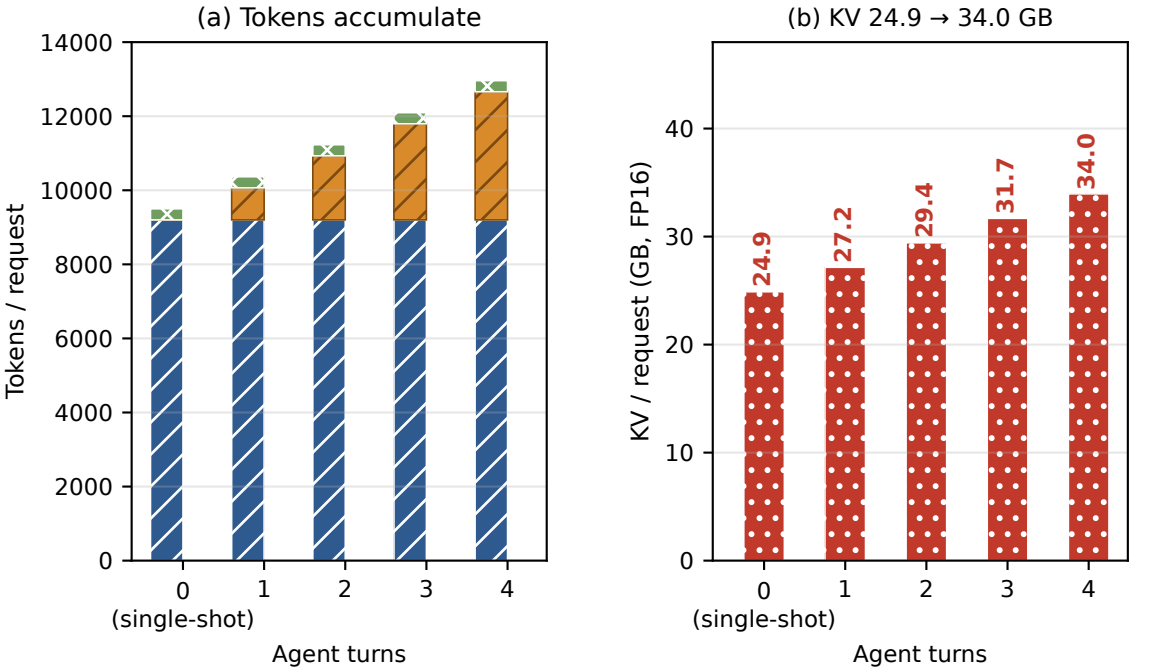
Token growth vs resulting KV growth across agent turns

append-only illustrative model: context only ever accumulates across turns — nothing is evicted



counterfactual: each column = a separate completion after T turns,
including one final 300-token answer — not successive states of one live agent.

initial context (I_0)
added per turn (δ=800 + γ=65)
output tokens (O=300)
KV / request (FP16)
