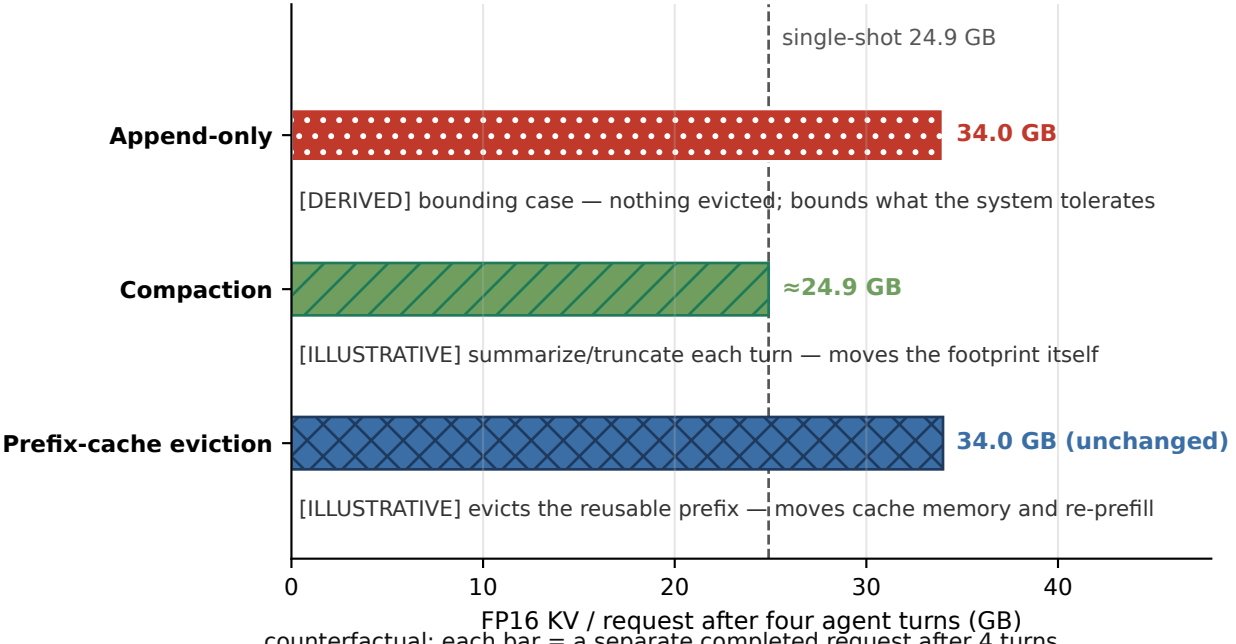
State-management policy at turn 4: three policies move three different things

canonical 2.62 MB/token; only the append-only bar is derived



counterfactual: each bar = a separate completed request after 4 turns

(one final 300-token answer) — not an intermediate state of a live agent.

append-only total = $l_0 + T\cdot\delta + T\cdot\gamma + O_{final}$ @ 2.62 MB/token

(l_0 = 9.2K input, δ = 800 retrieved, γ = 65 generated, O = 300 output per turn)
